

Supplementary Figure 4: GPR84 agonist lauric acid increases release of GLP-1 and PYY from mouse explants.

- Stimulation of mouse explant tissue with lauric acid (25 mmol^{-1}) significantly increases GLP-1 release compared to stimulation with buffer control. $N=5/\text{group}$.
- Stimulation of mouse explant tissue with lauric acid (25 mmol^{-1}) significantly increases PYY release compared to stimulation with buffer control. $N=5/\text{group}$.
