

Appendix 1.

Crohn's and colitis UK: Follow up questionnaire responses from the IBD Surveillance Colonoscopies focus group

	I think it is reasonable and fair to arrange procedures for patients most at risk of bowel cancer with IBD first.	I would support the short-term proposal to use stool tests to prioritise patients waiting for surveillance procedures to manage the current backlog	I think it is reasonable to postpone or stop surveillance procedures in some patients who are deemed to be very low risk of IBD related bowel cancer	I would support research to identify non-invasive (for example stool or blood) biomarkers to predict future bowel cancer risk in patients with IBD
